

# Research Document (MySQL Spatial Data Types, Storing spatial data and using it to create a Restful Web service)

**Aim:** The aim of the document is to successfully research ways to be able to store geo spatial data in MySQL database

**Why:** Currently (24 Feb, 2017) I have been using SAP Hana HCP but the issue is its not free and is very expensive to move from trail to pro version, so the better alternative is MySQL if I am successfully able to implement what I was able to do with HCP. And, the advantages will be free of cost, HCP trail needs restart every 12 hours and auto deletes after 6 days which is a big disadvantage, MySQL will allow 99% uptime for web service.

\*\*\*\*\*

Importance of the external resources used based on Level:

*Level (High) – Very helpful and important*

*Level (Medium) – Important and Some what helpful and related*

*Level (Low) – Helped to see some light, but not very useful resource.*

\*\*\*\*\*

## Table of Contents

Importance of the external resources used based on Level:.....	1
*****Creating a table with geometry***** .....	1
Query to show the columns in the table: .....	1
***Quite close to solving problem of inserting spatial data into MySQL*** .....	2
***Working SQL Statement to insert spatial data in MySQL (Polygon and Point)***** .....	2

\*\*\*\*\*Creating a table with geometry\*\*\*\*\*

create table myspatialdata (id integer(7), bpolygon Geometry, mpoint Geometry);

\*\*\*\*\*

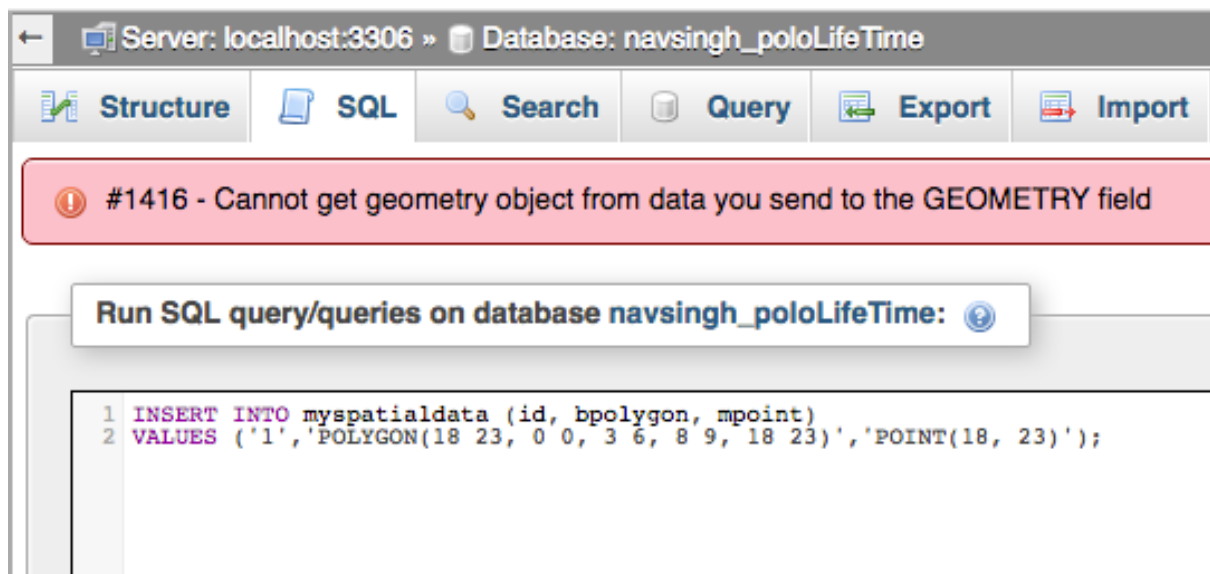

Query to show the columns in the table:

**SHOW COLUMNS FROM** myspatialdata

Field	Type	Null	Key	Default	Extra
id	int(7)	YES		NULL	
bpolygon	geometry	YES		NULL	
mpoint	geometry	YES		NULL	

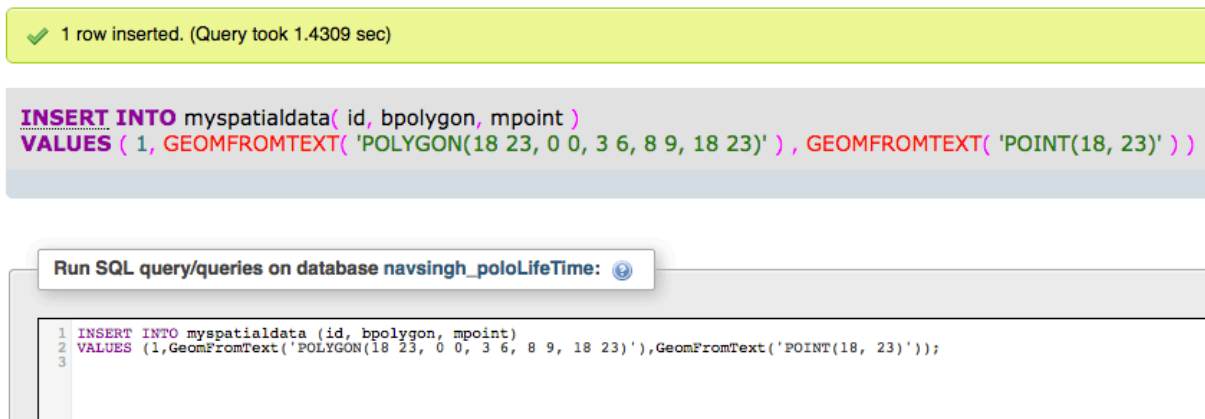

\*\*\*Quite close to solving problem of inserting spatial data into MySQL\*\*\*

```
INSERT INTO myspatialdata (id, bpolygon, mpoint)
VALUES ('1','POLYGON(18 23, 0 0, 3 6, 8 9, 18 23)','POINT(18, 23));
```

\*\*\*\*Working SQL Statement to insert spatial data in MySQL (Polygon and Point)\*\*\*\*\*

```
INSERT INTO myspatialdata (id, bpolygon, mpoint)
VALUES (1,GeomFromText('POLYGON(18 23, 0 0, 3 6, 8 9, 18 23)'),GeomFromText('POINT(18, 23)'));
```

```
INSERT INTO myspatialdata (id, bpolygon, mpoint)
VALUES (2,GeomFromText('POLYGON(-74.13591384887695 40.93750722242824,-
74.13522720336914 40.929726129575016,-74.15102005004883 40.9329683629703,-
74.14329528808594 40.94256444133327)'),GeomFromText('POINT(-
74.13591384887695,40.93750722242824)'));
```

```
INSERT INTO myspatialdata( id, bpolygon, mpoint )
VALUES ( 2, GEOMFROMTEXT(
'POLYGON(-74.13591384887695 40.93750722242824,-74.13522720336914 40.929726129575016,-74.15102005004883 40.932968362
), GEOMFROMTEXT( 'POINT(-74.13591384887695,40.93750722242824)' ) )
```

[ Edit ] [ Create PHP Code ]

Run SQL query/queries on database navsingh\_poloLifeTime: 

```
1 INSERT INTO myspatialdata (id, bpolygon, mpoint)
2 VALUES (2,GeomFromText('POLYGON(-74.13591384887695 40.93750722242824,-74.13522720336914 40.929726129575016,-74.15102005004883
3 40.9329683629703,-74.14329528808594 40.94256444133327)'),GeomFromText('POINT(-74.13591384887695,40.93750722242824)'));
```

RESEARCH RESULTS: PASSED (Working)

## 1 Resources for Functiona Requirements

Requirement 7:

Requirement 8: Photo Upload

Image upload example with Swift and PHP - <http://swiftdeveloperblog.com/image-upload-example/>

Requirement 9:

## 2 Final Report Database

1- Companies Table (mrp\_companies) to store all the information regarding the different companies this will allow us to –

- 1- Use app for multiple companies/organisations/institutions by storing data for different companies and use it in a single app (example- city council can buy the app to list the different public properties/companies and the available buildings/meeting rooms in them)
- 2- or just use the app for one company (example – Our college – for NCI use only can be deployed as an internal app)

Table name:  Add  column(s) [Go](#)

Name	Type	Length/Values	Default	Collation	Attributes	Null	Index
companyId	INT	120	None			<input type="checkbox"/>	PRIMARY

  `directions` VARCHAR(480) NOT NULL , PRIMARY KEY (`meetingRoomId`))ENGINE = MyISAM;
```

### 3 Final Report Xcode

#### Project Guide

This guide will help understand the requirement for opening and running this project- MeetingRoom Pro is an ios (Swift) project, in order to use open the project code we require the following:

- Apple Mackbook (I am using Macbook Pro, 6 GB Ram, 2.3 GHz Intel Core i5)

#### Installing Xcode

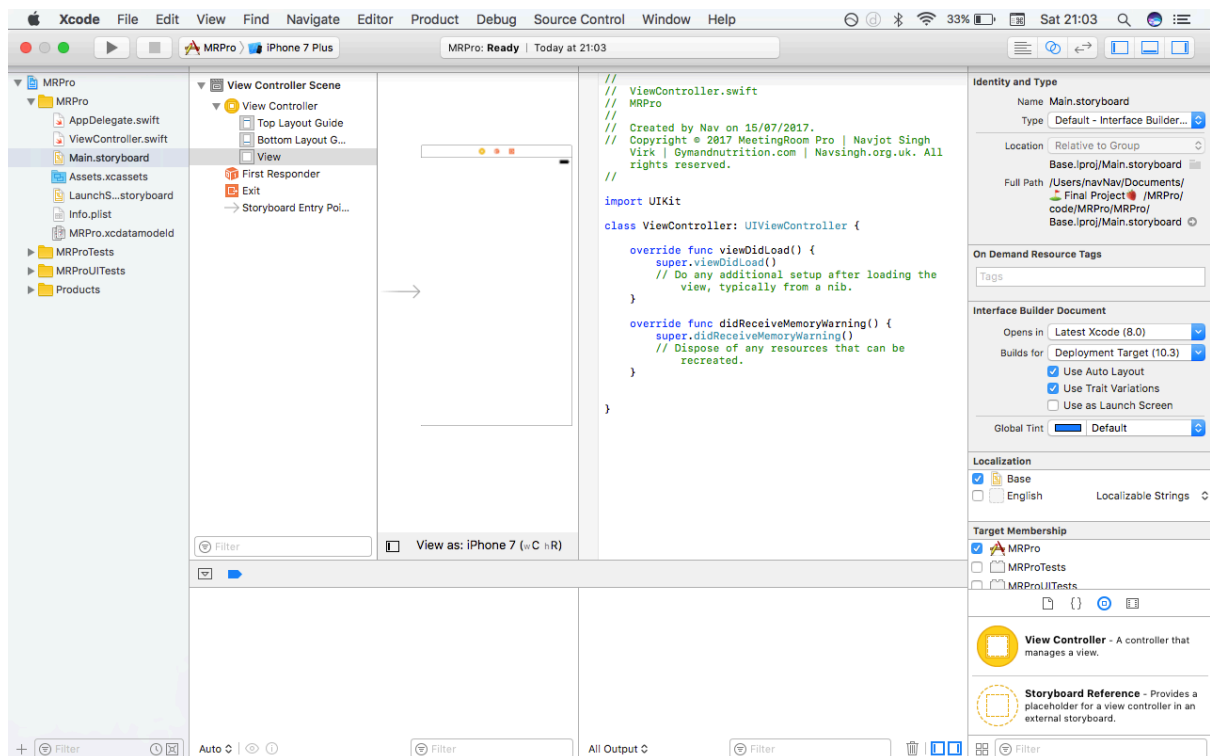

Describe xcode and its features in detail in the final report.

Install Xcode on your Mac, using Appstore or this link:

<https://developer.apple.com/xcode/ide/>

This is how a project in Xcode Ide looks like –

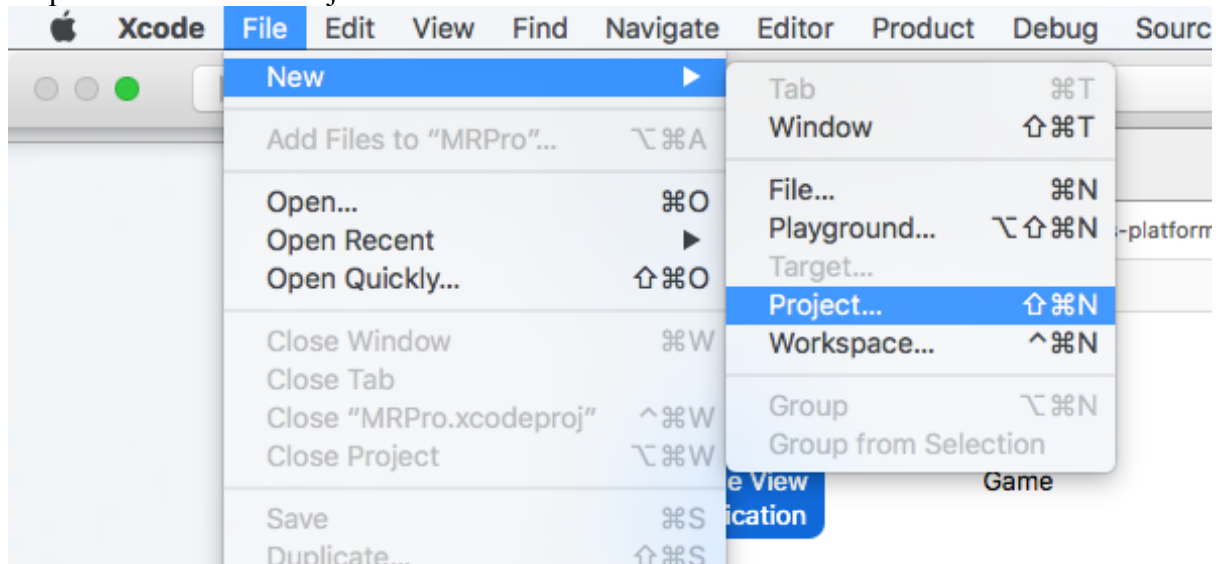

## Opening the Project

Use MRPro.xcworkspace file to open the project in xcode.

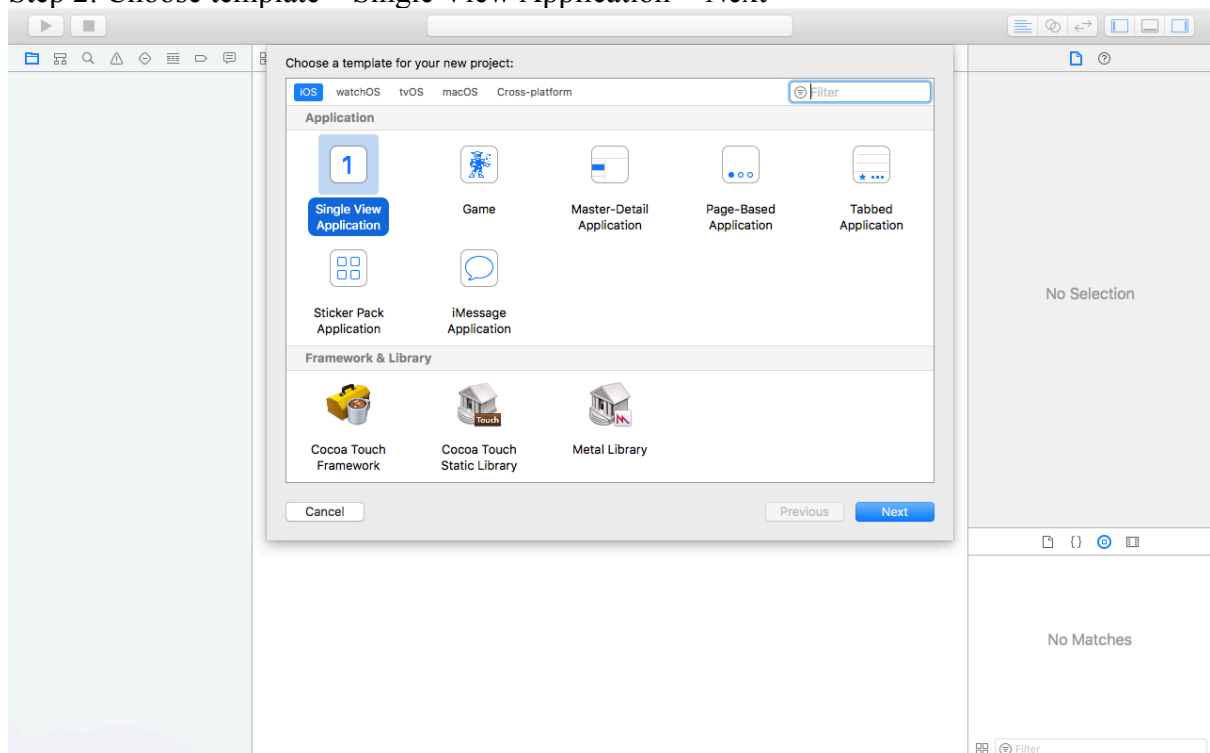

## Creating Project

Basic Steps involved in Project Creation

Step 1: File > New > Project

Step 2: Choose template – Single View Application > Next

Step 3:

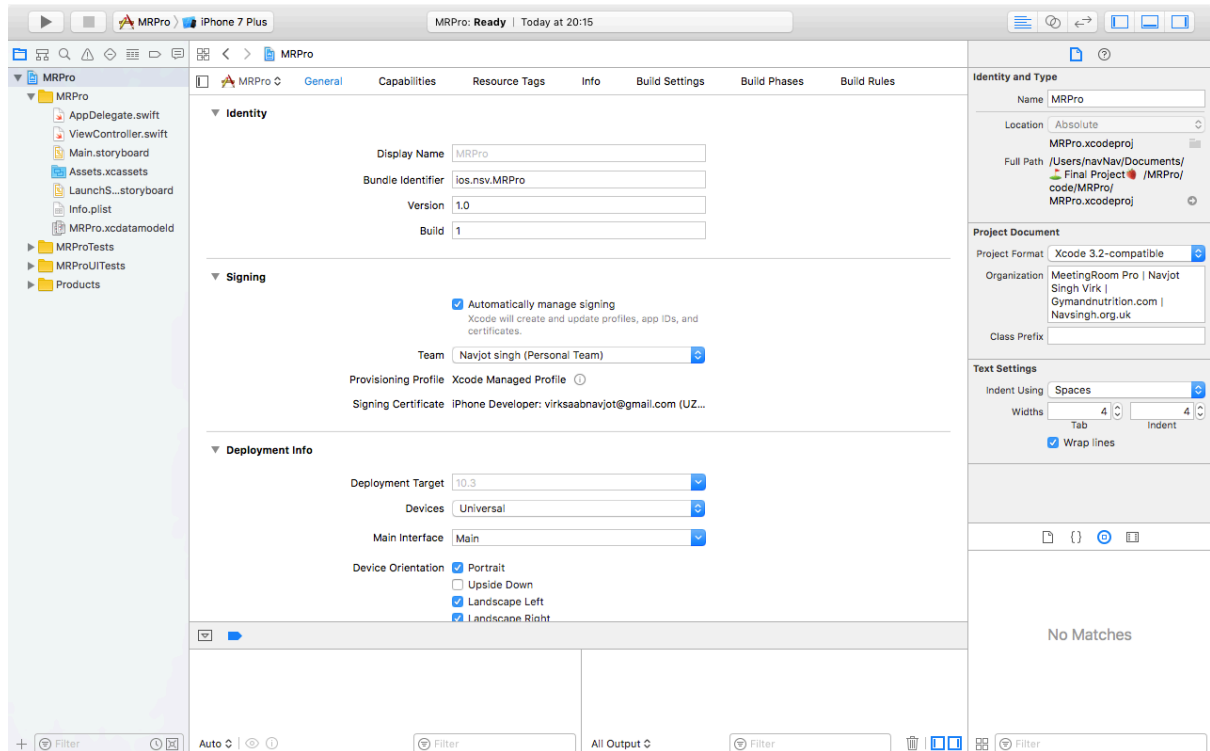

- Enter Product Name (aka. Project name) – MRPro (aka. MeetingRoom Pro)

- Select Team (Personal ios developer account – just signin with your apple id and xcode will take care of the rest)
- Organisation Identifier: ios.nsv (it could be anything (but unique) you like but it should usually make some sence and be short, simple and sweet like in this example- ios signifies its an ios app and nsv – Navjot singh virk)
- Select Language: Swift will be used for this project.
- Devices: Universal means the app will be supported on both iphones and ipads (you can also choose any one of them if you want to limit certain device type users).
- Others: Include UnitTests and UTests
- Press > Next

Step 4: Save the project on computer at location of your choice

Step 5: New Xcode project opens in a new window

Step 6: At this stage project is ready and can be run on an emulator or a real ios device.

Step 7: Start making changes (write code)

## Cocoapods

Installing Cocoapods (on my computer which will allow us to use different useful cocoapods available on the internet).

```

Last login: Sat Jul 15 20:08:43 on ttys000
[Navs-MacBook-Pro:~ navNav$ sudo gem install cocoapods
>Password:

```

Explain cocoapods a bit in the final report

## Create Pod File

In order to use Cocoapods we need to create a Podfile for our project.

- Open Terminal
- Navigate to the project folder
- To create the Podfile run this command in the terminal: `$ pod init`

```

22 gems installed
[code/MRPro k-Pro:~ navNav$ cd /Users/navNav/Documents/Final\ Project /MRPro/
Navs-MacBook-Pro:MRPro navNav$ ls
MRPro          MRPro.xcodeproj MRProTests     MRProUITests
Navs-MacBook-Pro:MRPro navNav$ pod init
Navs-MacBook-Pro:MRPro navNav$ ls
MRPro          MRPro.xcodeproj MRProTests     MRProUITests  Podfile
Navs-MacBook-Pro:MRPro navNav$ █

```

As we can see a Podfile was created when we ran the 'ls' command second time to list the contents of the project folder.

- Open Podfile in an editor and write > pod 'SwiftyJSON' to add our first pod that will help in handling JSON better (it's a very popular library/pod among ios developer community when it comes to handling JSON in ios Swift).

```

1  platform :ios, '9.0'
2
3  target 'MRPro' do
4      # Comment the next line if you're not using Swift and don't want to use dynamic frameworks
5      use_frameworks!
6
7      # Pods for MRPro
8      pod 'SwiftyJSON'
9
10     target 'MRProTests' do
11         inherit! :search_paths
12         # Pods for testing
13     end
14
15     target 'MRProUITests' do
16         inherit! :search_paths
17         # Pods for testing
18     end
19
20 end
21

```

- Save Podfile > Run this command in terminal - \$ pod install
- Close project in Xcode.
- Open the newly generated – MRPro.xcworkspace. And now onwards everytime to open/work on the project MRPro.xcworkspace should be used instead of MRPro.xcodeproj
